2 Data Structures

2.1 Bit Binary Search

```
// --- Bit Binary Search in o(log(n)) ---
const int M = 20
const int N = 1 << M

int lower_bound(int val) {
    int ans = 0, sum = 0;
    for(int i = M - 1; i >= 0; i--) {
        int x = ans + (1 << i);
        if(sum + bit[x] < val)
            ans = x, sum += bit[x];
    }
    return ans + 1;
}
```

2.2 Bit Range

```
struct BIT {
    ll b[N]={};
    ll sum(int x) {
        ll r=0;
        for (x+=2; x; x-=x&-x)
            r += b[x];
        return r;
    }
    void upd(int x, ll v) {
        for (x+=2; x<N; x+=x&-x)
            b[x] += v;
    }
};

struct BITRange {
    BIT a, b;
    ll sum(int x) {
        return a.sum(x) * x + b.sum(x);
    }
    void upd(int l, int r, ll v) {
        a.upd(l, v), a.upd(r+1, -v);
        b.upd(l, -v*(l-1)), b.upd(r+1, v*r);
    }
};
```

2.3 Bit

```
// Fenwick Tree / Binary Indexed Tree
ll bit[N];

void add(int p, int v) {
    for (p += 2; p < N; p += p & -p) bit[p] += v;
}

ll query(int p) {
    ll r = 0;
```

```

    for (p += 2; p; p -= p & -p) r += bit[p];
    return r;
}

```

2.4 Bit 2D

```

// Fenwick Tree 2D / Binary Indexed Tree 2D
int bit[N][N];

void add(int i, int j, int v) {
    for (; i < N; i+=i&-i)

```

3 Dynamic Programming

3.1 Convex Hull Trick (emaxx)

```
struct Point {
    ll x, y;
    Point (ll x = 0, ll y = 0) : x(x), y(y) {}
    Point operator-(Point p) { return Point(x - p.x, y - p.y); }
    Point operator+(Point p) { return Point(x + p.x, y + p.y); }
    Point ccw() { return Point(-y, x); }
    ll operator%(Point p) { return x*p.y - y*p.x; }
    ll operator*(Point p) { return x*p.x + y*p.y; }
    bool operator<(Point p) const { return x == p.x ? y < p.y : x < p.x; }
};
```

```

pair<vector<Point>, vector<Point>> ch(Point *v){
    vector<Point> hull, vecs;
    for(int i = 0; i < n; i++){
        if(hull.size() and hull.back().x == v[i].x) continue;

        while(vecs.size() and vecs.back().*(v[i] - hull.back()) <= 0)
            vecs.pop_back(), hull.pop_back();

        if(hull.size())
            vecs.pb((v[i] - hull.back()).ccw());

        hull.pb(v[i]);
    }
    return {hull, vecs};
}

ll get(ll x) {
    Point query = {x, 1};
    auto it = lower_bound(vecs.begin(), vecs.end(), query, [](Point a, Point b) {
        return a%b > 0;
    });
    return query*hull[it - vecs.begin()];
}

```

3.2 Convex Hull Trick

```

// Convex Hull Trick

// ATTENTION: This is the maximum convex hull. If you need the minimum
// CHT use {-b, -m} and modify the query function.

// In case of floating point parameters swap long long with long double
typedef long long type;
struct line { type b, m; };

line v[N]; // lines from input
int n; // number of lines
// Sort slopes in ascending order (in main):
sort(v, v+n, [](line s, line t){
    return (s.m == t.m) ? (s.b < t.b) : (s.m < t.m); });

// nh: number of lines on convex hull
// pos: position for linear time search
// hull: lines in the convex hull
int nh, pos;

4.19 Min Cost Max Flow

```
// USE INF = 1e9!

/*****
 * MIN COST MAX FLOW (MINIMUM COST TO ACHIEVE MAXIMUM FLOW)
 * Description: Given a graph which represents a flow network where every edge has *
```

```
* a capacity and a cost per unit, find the minimum cost to establish the maximum *
* possible flow from s to t.
* Note: When adding edge (a, b), it is a directed edge!
* Usage: min_cost_max_flow()
*         add_edge(from, to, cost, capacity)
* Notation: flw: max flow
*           cst: min cost to achieve flw
* Testcase:
* add_edge(src, 1, 0, 1); add_edge(1, snk, 0, 1); add_edge(2, 3, 1, INF);
* add_edge(src, 2, 0, 1); add_edge(2, snk, 0, 1); add_edge(3, 4, 1, INF);
* add_edge(src, 2, 0, 1); add_edge(3, snk, 0, 1);
* add_edge(src, 2, 0, 1); add_edge(4, snk, 0, 1); => flw = 4, cst = 3

7 Geometry

7.1 Miscelananeous

```

/*
1) Square (n = 4) is the only regular polygon with integer coordinates

2) Pick's theorem: A = i + b/2 - 1
A: area of the polygon
i: number of interior points
b: number of points on the border

3) Conic Rotations
Given ellipse: Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0
Convert it to: Ax^2 + Bxy + Cy^2 + Dx + Ey = 1 (this formula suits better for elipse, before doing this
verify F = 0)
Final conversion: A(x + D/2A)^2 + C(y + E/2C)^2 = 1 + D^2/4A + E^2/4C
B != 0 (Rotate):
    theta = atan2(b, c-a)/2.0;

```

```

    A' = (a + c + b/sin(2.0*theta))/2.0; // A
    C' = (a + c - b/sin(2.0*theta))/2.0; // C
    D' = d*sin(theta) + e*cos(theta); // D
    E' = d*cos(theta) - e*sin(theta); // E
    Remember to rotate again after!
*/

// determine if point is in a possibly non-convex polygon (by William
// Randolph Franklin); returns 1 for strictly interior points, 0 for
// strictly exterior points, and 0 or 1 for the remaining points.
// Note that it is possible to convert this into an *exact* test using
// integer arithmetic by taking care of the division appropriately
// (making sure to deal with signs properly) and then by writing exact
// tests for checking point on polygon boundary

```

7.12 Voronoi Diagram

```

/*
Complexity: O(nlogn)
Code by Monogon: https://codeforces.com/blog/entry/85638
This code doesn't work when two points have the same x coordinate.
This is handled simply by rotating all input points by 1 radian and praying to the geometry gods.

The definition of the Voronoi diagram immediately shows signs of applications.
* Given a set S of n points and m query points p1,...,pm, we can answer for each query point, its nearest neighbor in S.
  This can be done in O((n+q)log(n+q)) offline by sweeping the Voronoi diagram and query points.
  Or it can be done online with persistent data structures.

* For each Delaunay triangle, its circumcircle does not strictly contain any points in S. (In fact, you can also consider this the defining property of Delaunay triangulation)

* The number of Delaunay edges is at most 3n - 6, so there is hope for an efficient construction.

* Each point p belongs to S is adjacent to its nearest neighbor with a Delaunay edge.

```

```

* The Delaunay triangulation maximizes the minimum angle in the triangles among all possible triangulations
.

* The Euclidean minimum spanning tree is a subset of Delaunay edges.

```

8.12 Week day

```
int v[] = { 0, 3, 2, 5, 0, 3, 5, 1, 4, 6, 2, 4 };
int day(int d, int m, int y) {
    y -= m<3;
    return (y + y/4 - y/100 + y/400 + v[m-1] + d)%7;
}
```

9 Math Extra

9.1 Combinatorial formulas

$$\begin{aligned}
 \sum_{k=0}^n k^2 &= n(n+1)(2n+1)/6 \\
 \sum_{k=0}^n k^3 &= n^2(n+1)^2/4 \\
 \sum_{k=0}^n k^4 &= (6n^5 + 15n^4 + 10n^3 - n)/30 \\
 \sum_{k=0}^n k^5 &= (2n^6 + 6n^5 + 5n^4 - n^2)/12 \\
 \sum_{k=0}^n x^k &= (x^{n+1} - 1)/(x - 1) \\
 \sum_{k=0}^n kx^k &= (x - (n+1)x^{n+1} + nx^{n+2})/(x - 1)^2 \\
 \binom{n}{k} &= \frac{n!}{(n-k)!k!} \\
 \binom{n}{k} &= \binom{n-1}{k} + \binom{n-1}{k-1} \\
 \binom{n}{k} &= \frac{n}{n-k} \binom{n-1}{k} \\
 \binom{n}{k} &= \frac{n-k+1}{k} \binom{n}{k-1} \\
 \binom{n+1}{k} &= \frac{n+1}{n-k+1} \binom{n}{k} \\
 \binom{n}{k+1} &= \frac{n-k}{k+1} \binom{n}{k} \\
 \sum_{k=1}^n k \binom{n}{k} &= n2^{n-1} \\
 \sum_{k=1}^n k^2 \binom{n}{k} &= (n + n^2)2^{n-2} \\
 \binom{m+n}{r} &= \sum_{k=0}^r \binom{m}{k} \binom{n}{r-k} \\
 \binom{n}{k} &= \prod_{i=1}^k \frac{n-k+i}{i}
 \end{aligned}$$

9.2 Number theory identities

Lucas' Theorem: For non-negative integers m and n and a prime p ,

$$\binom{m}{n} \equiv \prod_{i=0}^k \binom{m_i}{n_i} \pmod{p},$$

where

$$m = m_k p^k + m_{k-1} p^{k-1} + \cdots + m_1 p + m_0$$

is the base p representation of m , and similarly for n .

9.3 Stirling Numbers of the second kind

Number of ways to partition a set of n numbers into k non-empty subsets.

$$\left\{ \begin{matrix} n \\ k \end{matrix} \right\} = \frac{1}{k!} \sum_{j=0}^k (-1)^{(k-j)} \binom{k}{j} j^n$$

Recurrence relation:

$$\begin{aligned} \left\{ \begin{matrix} 0 \\ 0 \end{matrix} \right\} &= 1 \\ \left\{ \begin{matrix} n \\ 0 \end{matrix} \right\} &= \left\{ \begin{matrix} 0 \\ n \end{matrix} \right\} = 1 \end{aligned}$$

$$\left\{ \begin{matrix} n+1 \\ k \end{matrix} \right\} = k \left\{ \begin{matrix} n \\ k \end{matrix} \right\} + \left\{ \begin{matrix} n \\ k-1 \end{matrix} \right\}$$

9.4 Burnside's Lemma

Let G be a finite group that acts on a set X . For each g in G let X^g denote the set of elements in X that are fixed by g , which means $X^g = \{x \in X | g(x) = x\}$. Burnside's lemma asserts the following formula for the number of orbits, denoted $|X/G|$:

$$|X/G| = \frac{1}{|G|} \sum_{g \in G} |X^g|$$

9.5 Numerical integration

RK4: to integrate $\dot{y} = f(t, y)$ with $y_0 = y(t_0)$, compute

$$\begin{aligned} k_1 &= f(t_n, y_n) \\ k_2 &= f(t_n + \frac{h}{2}, y_n + \frac{h}{2} k_1) \\ k_3 &= f(t_n + \frac{h}{2}, y_n + \frac{h}{2} k_2) \\ k_4 &= f(t_n + h, y_n + h k_3) \\ y_{n+1} &= y_n + \frac{h}{6} (k_1 + 2k_2 + 2k_3 + k_4) \end{aligned}$$
